Advice for minimizing the influence of bias and assumptions:

- Strive to increase the representation of women and minorities in your applicant pool. Research shows that gender assumptions are more likely to negatively influence evaluation of women when they represent a small proportion (less than 25%) of the pool of candidates (Heilman).

- Learn about and discuss research on biases and assumptions and consciously strive to minimize their influence on your evaluation. Experimental studies show that greater awareness of discrepancies between the ideals of impartiality and actual performance, together with strong internal motivations to respond without prejudice, effectively reduces prejudicial behavior (Devine et al.).

- Develop evaluation criteria prior to evaluating candidates and apply them consistently to all applicants. Research shows that different standards may be used to evaluate male and female applicants and that when criteria are not clearly articulated before reviewing candidates, evaluators may shift or emphasize criteria that favor candidates from well-represented demographic groups (Biernat and Fuegen; Uhlmann and Cohen).

- Spend sufficient time (at least 20 minutes) evaluating each applicant. Evaluators who were busy, distracted by other tasks, and under time pressure gave women lower ratings than men for the same written evaluation of job performance. Sex bias decreased when they were able to give all their time and attention to their judgments, and valuable perspectives on research and teaching.

- Have the accomplishments, ideas, and findings of women or minority candidates been undervalued or unfairly attributed to a research director or collaborators despite contrary evidence in publications or letters of reference? (Recall the biases seen in evaluations of written descriptions of job performance.)

- Is the ability of women or minorities to run a research group, raise funds, and supervise students and staff of different gender or ethnicity being underestimated? (Recall social assumptions about leadership abilities.)

- Are assumptions about possible family responsibilities and their effect on a candidate’s career path negatively influencing evaluation of a candidate’s merit, despite evidence of productivity? (Recall studies of the influence of generalizations on evaluation.)

- Are negative assumptions about whether women or minority candidates will “fit in” to the existing environment influencing evaluation? (Recall the biases seen in résumé evaluation based on name.)

Be able to defend every decision for eliminating or advancing a candidate. Research shows that holding evaluators to high standards of accountability for the fairness of their evaluation reduces the influence of bias and assumptions (Foschi).

Periodically evaluate your judgments, determine whether qualified women and underrepresented minorities are included in your pool, and consider whether evaluation biases and assumptions are influencing your decisions by asking yourself the following questions:

- Are women and minority candidates subject to different expectations in areas such as numbers of publications, name recognition, or personal acquaintance with a committee member? (Recall the example of the Swedish Medical Research Council.)

- Are candidates from institutions other than the major research universities that have trained most of our faculty being undervalued? (Qualified candidates from institutions such as historically black universities, four-year colleges, government, or industry might offer innovative, diverse, and valuable perspectives on research and teaching.)

- Have the accomplishments, ideas, and findings of women or minority candidates been undervalued or unfairly attributed to a research director or collaborators despite contrary evidence in publications or letters of reference? (Recall the biases seen in evaluations of written descriptions of job performance.)

- Is the ability of women or minorities to run a research group, raise funds, and supervise students and staff of different gender or ethnicity being underestimated? (Recall social assumptions about leadership abilities.)

- Are assumptions about possible family responsibilities and their effect on a candidate’s career path negatively influencing evaluation of a candidate’s merit, despite evidence of productivity? (Recall studies of the influence of generalizations on evaluation.)

- Are negative assumptions about whether women or minority candidates will “fit in” to the existing environment influencing evaluation? (Recall the biases seen in résumé evaluation based on name.)

The results from controlled research studies demonstrate that people often hold implicit or unconscious assumptions that influence their judgments. Examples range from expectations or assumptions about physical or social characteristics associated with race, gender, and ethnicity to those associated with certain job descriptions, academic institutions, and fields of study.

It is important to note that in most studies examining evaluation and gender, the sex of the evaluator was not significant; both men and women share and apply the same assumptions about gender.

Recognizing unintended gender and group biases and other influences not related to the quality of candidates can help reduce their impact on your search and review of candidates.

Examples of common social assumptions or expectations:

- When shown photographs of people of the same height, evaluators overestimated the heights of male subjects and underestimated the heights of female subjects, even though a reference point, such as a doorway, was provided (Biernat et al.).

- When shown photographs of men with similar athletic abilities, evaluators rated the athletic ability of African American men higher than that of white men (Biernat and Manis).

- When asked to choose counselors from among a group of equally competent applicants who were neither exceptionally qualified nor unqualified for the position, students more often chose white candidates than African American candidates, indicating their willingness to give members of the majority group the benefit of the doubt (Dovidio and Gaertner).

These studies show that we often apply generalizations that may or may not be valid to the evaluation of individuals (Biernat and Baron). In the study on height, evaluators applied the statistically accurate generalization that on average, men are taller than women to their estimates of the height of individuals who did not necessarily conform to the generalization. If generalizations can lead us to inaccurately evaluate characteristics as objective and easily measured as height, what happens when the qualities we are evaluating are not as objective or as easily measured? What happens when the generalizations are not accurate?

Examples of assumptions or biases that can influence the evaluation of applications:

- When rating the quality of verbal skills as indicated by vocabulary definitions, evaluators rated the skills lower if they were told an African American provided the definitions than if they were told that a white person provided them (Biernat and Manis).

- Randomly assigning different names to résumés showed that job applicants with "white-sounding names" were more likely to be interviewed for open positions than were equally qualified applicants with "African American-sounding names" (Bertrand and Sendhil).

Examples of assumptions or biases in academic job-related contexts:

- A study of over 300 recommendation letters for medical faculty hired by a large U.S. medical school found that letters for female applicants differed systematically from those for males. Letters written for women were shorter, provided "minimal assurance" rather than solid recommendation, raised more doubts, portrayed women as students and teachers while portraying men as researchers and professionals, and more frequently mentioned women's personal lives (Trix and Pienka).

- In a national study, 238 academic psychologists (118 male, 120 female) evaluated a curriculum vitae randomly assigned a male or a female name. Both male and female participants gave the male applicant better evaluations for teaching, research, and service experience and were more likely to hire the male than the female applicant (Steinpreis et al.).

- A study of postdoctoral fellowships awarded by the Medical Research Council of Sweden found that women candidates needed substantially more publications to achieve the same rating as men, unless they personally knew someone on the panel (Wennekás and Wold).

- When we assume "that cultural, racial, ethnic, and gender biases are simply non-existent [in] screening and evaluation processes, there is grave danger that minority and female candidates will be rejected." — CAROLINE S.V. TURNER
