

# **ASSESSMENT OF THE QUALITY OF INDIANA COALS FOR INTEGRATED GASIFICATION COMBINED CYCLE (IGCC) PERFORMANCE; ANALYSIS OF THE EXISTING DATA AND PROPOSAL OF NEW RESEARCH**

FINAL REPORT TO THE CENTER FOR COAL TECHNOLOGY RESEARCH

**Maria Mastalerz  
Agnieszka Drobniak  
John Rupp  
Nelson Shaffer**

# INTRODUCTION - PROJECT JUSTIFICATION

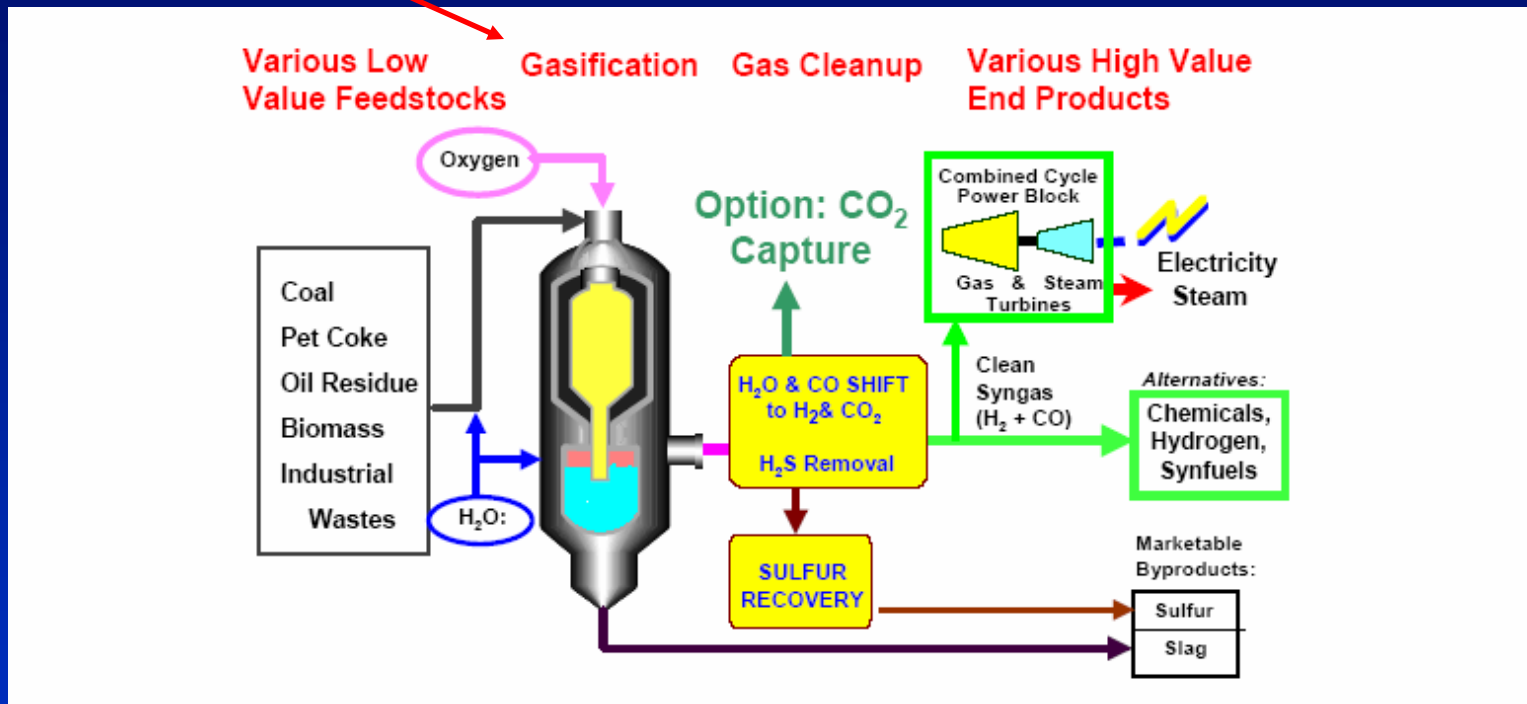

**Evaluating Indiana coals for IGCC is timely and important:**

- **Indiana has significant coal reserves (~57 billion short tons, of which 17.5 billion tons is available for mining). 73% of coal produced in Indiana is used to generate electricity and more than 90% of electricity generated in Indiana comes from coal**
- **Burning Indiana coal causes serious environmental concerns because the majority of Indiana coals have high sulfur content**
- **Integrated Gasification Combined Cycle (IGCC), being one of Clean Coal Technologies, could help Indiana. IGCC can achieve 99% SO<sub>2</sub> removal, removing also Hg and CO<sub>2</sub> upstream of the combustion process**

## Gasification:

- 1) Volatile pyrolysis – fast volatilization and compound degradation;
- 2) Char gasification

# IGCC plant

In the IGCC process, plants turn coal to gas, removing most of the sulfur dioxide and other emissions before the gas is used to fuel a combustion turbine generator. The hot gases are then used to heat steam, driving a steam turbine generator.

# PROJECT OBJECTIVES

- 1. Identify coal properties that are important for IGCC and assess availability of these types of data for Indiana coal beds.**
- 2. Outline future research needed to assess performance of Indiana coal during gasification:**
  - a) Propose new laboratory analyses,**
  - b) Suggest strategy for modeling coal performance in IGCC units.**
- 3. Identify budgetary needs, time requirements, possible collaborations and sources of matching funds.**

# PROJECT TASKS

**PROJECT DURATION: MARCH 1 – NOVEMBER 30, 2005**

<b>Tasks</b>	<b>Activity</b>	<b>Deadline</b>
<b>Task 1</b>	<b>Identifying properties of major importance to IGCC performance of Indiana coals</b>	<b>April 30</b>
<b>Task 2</b>	<b>Assessing availability of data on coal that are critical for IGCC</b>	<b>June 31</b>
<b>Task 3</b>	<b>Identify areas in which more data are needed</b>	<b>August 31</b>
<b>Task 4</b>	<b>Propose new research and finalizing report</b>	<b>November 30</b>

# Task 1:

**Identifying properties of major importance to IGCC performance of Indiana coals**

1. We performed intensive literature search on coal gasification from various sources and various countries. Based on the literature, we have identified major projects that are important references. Also based on the literature as well as our own research we have identified several parameters of coal quality that are very important for the performance in an IGCC system.
2. We developed summary tables that show how these coal properties influence IGCC behavior and what the requirements are for three types of gasifiers: fixed-bed gasifier, **fluidized –bed gasifier, and entrained-flow gasifier.**
3. We visited IGCC plants to get acquainted with the process and the products

## Example of a summary table for entrained flow gasifiers.

Parameter	Importance	Coal Requirements
<b>Moisture</b>	<ul style="list-style-type: none"> <li>influences gasifier efficiency (higher moisture - lower efficiency)</li> </ul>	- A range of moisture contents are used
<b>Volatile matter</b>	<ul style="list-style-type: none"> <li>influences the extent and rate of gasification reactions</li> </ul>	- A range of volatile matter contents are used
<b>Heating value</b>	<ul style="list-style-type: none"> <li>determines plant dimensions</li> <li>influences generation capacity (higher heating value – higher capacity and efficiency)</li> </ul>	- A range of heating values are used
<b>Ash content</b>	<ul style="list-style-type: none"> <li>influences net cycle efficiency (higher ash –lower efficiency)</li> <li>influences flux addition rate</li> </ul>	<25%
<b>AFT (flow, reduction)</b>	<ul style="list-style-type: none"> <li>influence melting ability of discharged slag (it needs to be melted below performance temperature)</li> <li>influences operating costs (higher temperature– higher costs)</li> </ul>	<1500°C
<b>Slag viscosity</b>	viscosity must be sufficiently low to ensure smooth slag flow down the gasifier walls	<ul style="list-style-type: none"> <li>Preferred &lt;15Pa.s</li> <li>Used up to 25 Pa.s</li> </ul>
<b>Char reactivity</b>	<ul style="list-style-type: none"> <li>influence the extent of carbon conversion (higher reactivity – higher cycle efficiency)</li> <li>influences oxygen consumption</li> </ul>	- A range of reactivities can be used because of higher operational temperature
<b>Sulfur</b>	<ul style="list-style-type: none"> <li>can cause corrosion of heat exchanger surfaces</li> <li>influences operating costs (higher sulfur –higher costs)</li> </ul>	- Preferred S<1.5%
<b>Nitrogen</b>	<ul style="list-style-type: none"> <li>contributes to NO<sub>x</sub> emissions</li> </ul>	
<b>Chlorine</b>	<ul style="list-style-type: none"> <li>forming HCl can poison gas cleaning system catalysts</li> <li>HCl can cause chloride stress corrosion</li> </ul>	<0.4% (ad)

## IGCC plant visits:

### 1) Eastman Gasification Plant, Kingsport, Tennessee

#### Facts:

- Funded in 1920 as part of Eastman Kodak, wood to methanol plant
- It was the first commercial U.S. gasification facility in 1983
- 98-99% availability with a spare gasifier; >98% on-stream time since 1984
- Remove >99.9% sulfur and soluble elemental sulfur and sulfuric acid
- Low cost vapor-phase removal >95% mercury (on activated carbon) for 22 years
- Low risk option for CO<sub>2</sub> capture, if needed
- Solid residue: vitreous non-reactive material, that of the larger grain size being sold, the smaller grain size is rich in carbon and is land filled

# IGCC plant visits:

## 2) Polk Station Power Plant, Florida

### Facts:

- Entrained flow one stage slurry fed gasifier –  
GE Texaco Technology
- 250MW plant opened in 1996 as DOE IGCC demonstration project
- **Remove >95% sulfur that is recovered as sulfuric acid**
- >80% (>90% on-peak) availability with no spare gasifier
- **No mercury removal, but low cost vapor-phase removal (like at Eastman) possible if needed**
- **Low risk option for CO<sub>2</sub> capture, if needed**
- **Solid residue as a vitreous slag; the larger grain size slag is sold to cement industry, the smaller grain size (rich in carbon) is recycled. Nothing is land-filled.**

Plant visits:

### 3) Wabash River Gasification Plant

#### Facts:

- Entrained flow two stage slurry fed gasifier Conoco Technology
- 260MW plant opened in 1990 as DOE IGCC demonstration project
- Remove >95% sulfur that is recovered as sulfuric acid
- No mercury removal, but low cost vapor-phase removal possible if needed
- Solid residue as a vitreous slag. Currently the feed is 100% petroleum coke of very low mineral matter content and >5% S content. Because such a low MM content, old slag is added to the gasifier.

# Task 2:

Assessing availability of data on coal that are critical for IGCC

- A database in Microsoft Access format has been created.

	Moisture	Fixed C	Volatiles	Ash fusion temp.	Char reactivity	Slag viscosity
Danville	252	131	131	14	0	14
Hymera	135	110	110	0	0	0
Springfield	651	306	306	0	0	1
U. Block	99	82	82	11	0	11
L. Block	156	53	53	14	0	14

Good coverage

NO DATA

- Maps of selected parameters have been generated

## Statistics of selected parameters for four coal beds from Indiana

	Danville				Hymera				Springfield				Lower Block			
	Min	Max	<b>Ave</b>	n	Min	Max	<b>Ave</b>	n	Min	Max	<b>Ave</b>	n	Min	Max	<b>Ave</b>	n

# Task 3:

Identify areas in which more data are needed

- **Char reactivity** – important for two-stage gasifiers – no data

## Gasification:

- 1) Volatile pyrolysis – fast volatilization and compound degradation;
- 2) Char gasification

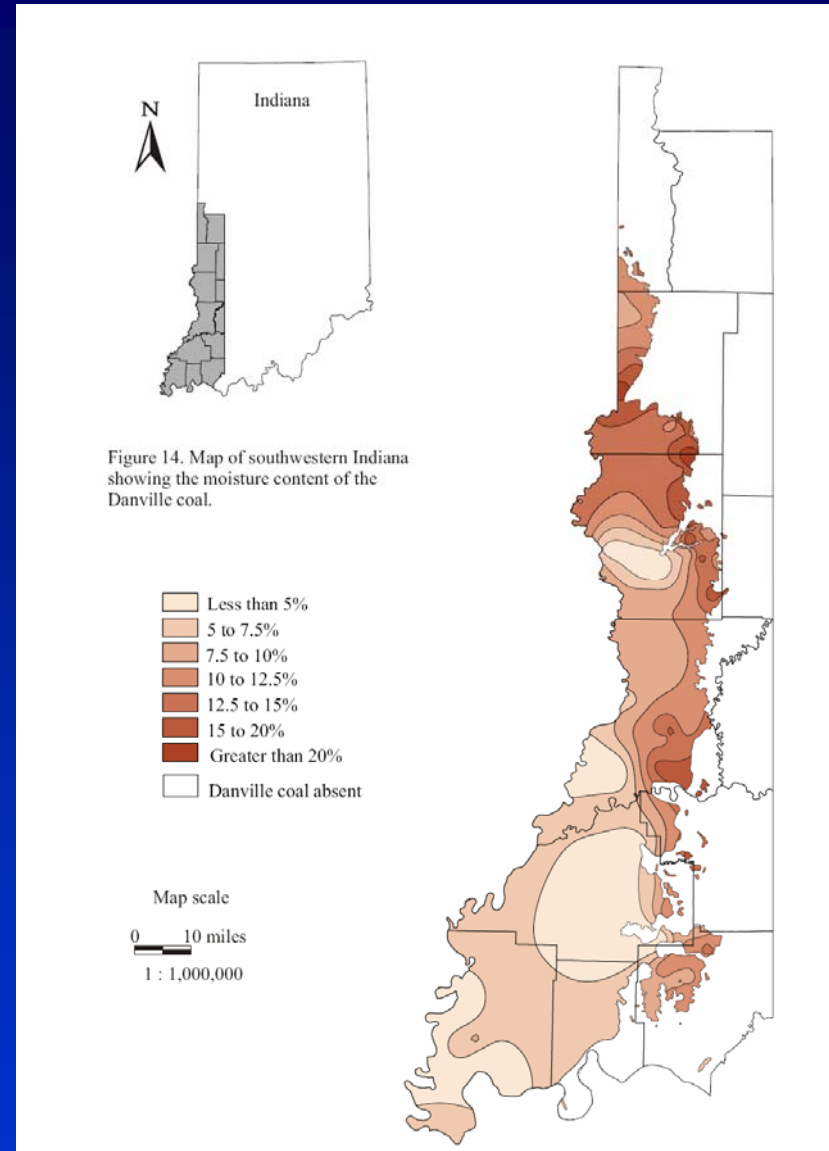

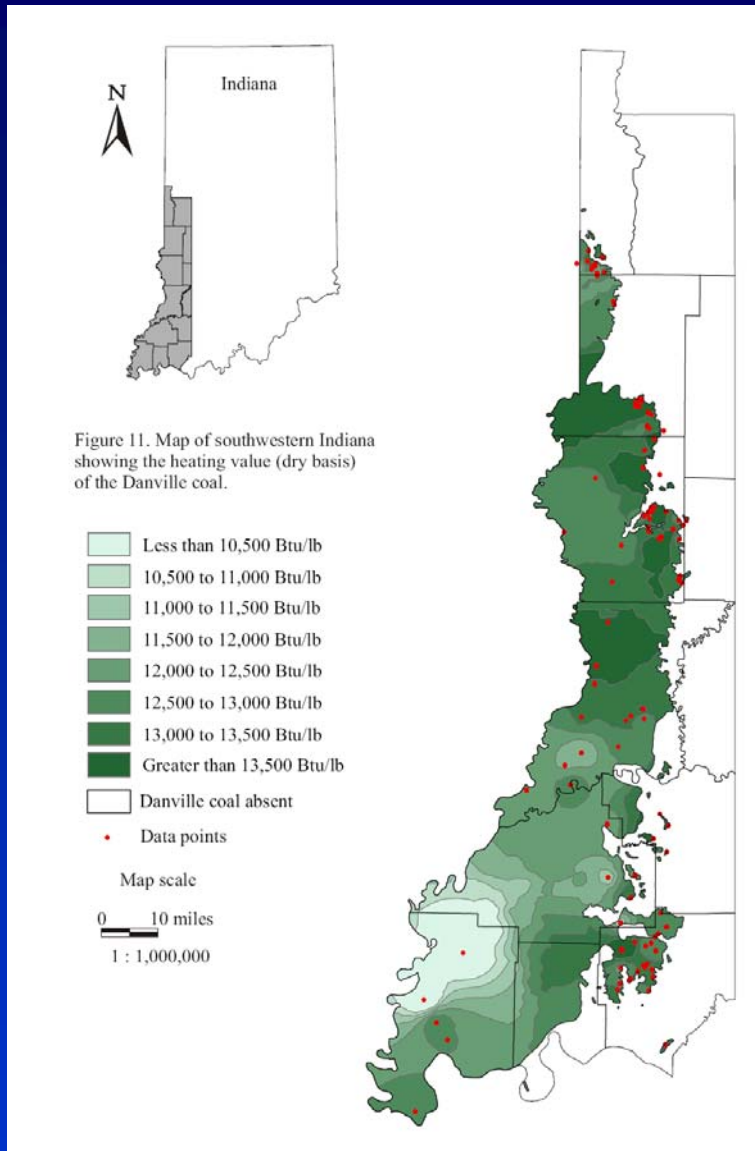

- **Ash chemical compositions** - limited data
- **Slag behavior** – critical for all gasifiers - very few data
- **Chlorine content** – insufficient data to show variability

# Preliminary evaluation of Indiana coals for IGCC

## A. Based on coal quality parameters

- Heating value
- Moisture content
- Ash yield
- Sulfur content
- Volatile matter content
- Fixed carbon

**Favorable BTU and moisture content**

Figure 17. Map of southwestern Indiana showing the ash content (dry basis) of the Danville coal.

Map scale  
 0 10 miles  
 1 : 1,000,000

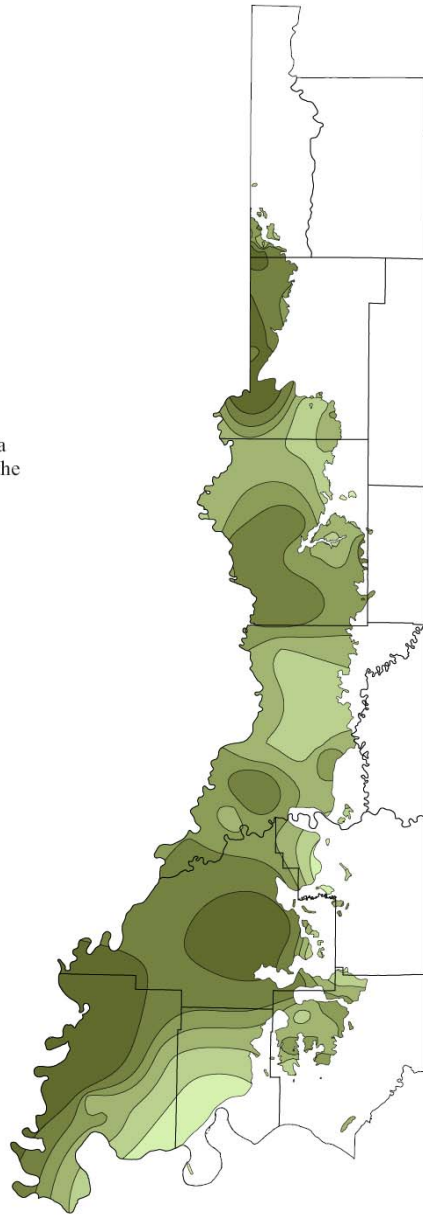

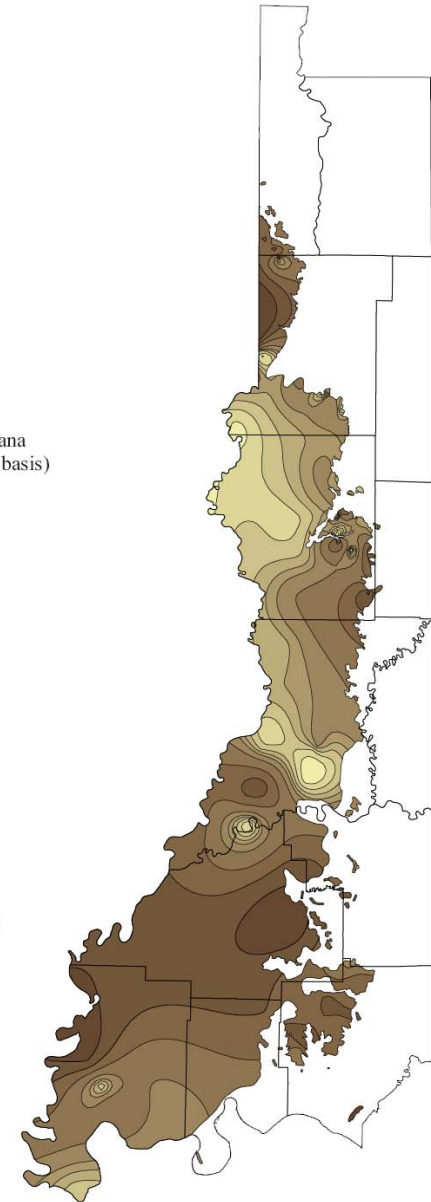

Figure 20. Map of southwestern Indiana showing the total sulfur content (dry basis) of the Danville coal.

Map scale  
 0 10 miles  
 1 : 1,000,000

## Favorable ash and ideal sulfur content

# Preliminary evaluation of Indiana coals for IGCC

## B. Based on char reactivity

(conversion of the char per time unit)

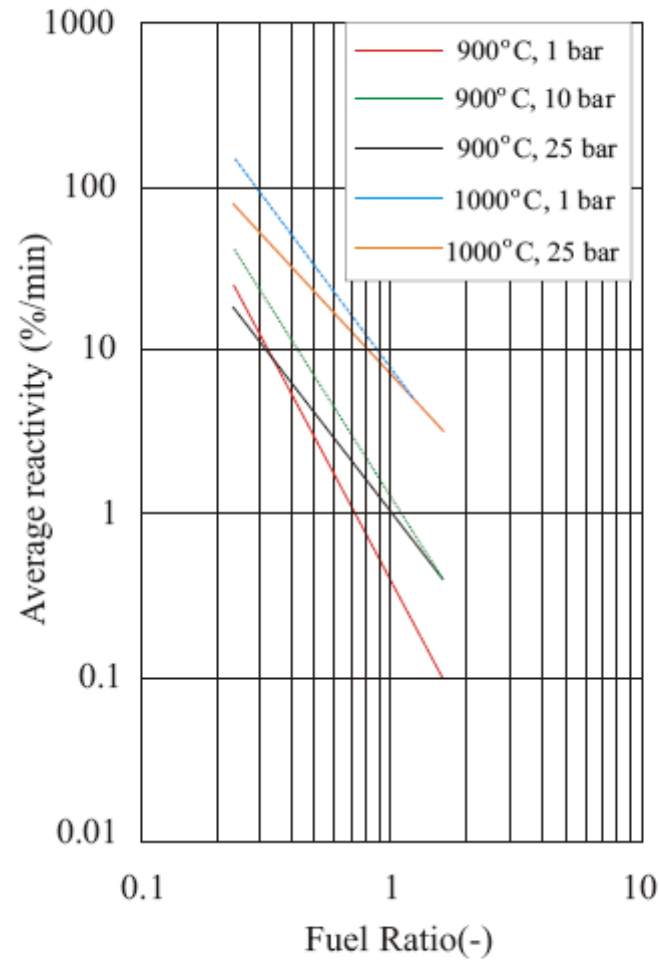

- Fuel ratio - ratio between Fixed carbon and Volatile matter

$$\text{Char reactivity (\%/min)} = 1.92 \times 10^{12} * \exp(-33260/\text{Temperature, K}) * (\text{Pressure, bar})^{0.011} * (\text{Fuel ratio})^{-1.22}$$

- Oxygen to carbon ratio

$$\text{Char reactivity (\%/min)} = 2.70 \times 10^{14} * \exp(-34452/\text{Temperature, K}) * (\text{Pressure, bar})^{0.012} * (\text{O/C, mol/mol})^{2.26}$$

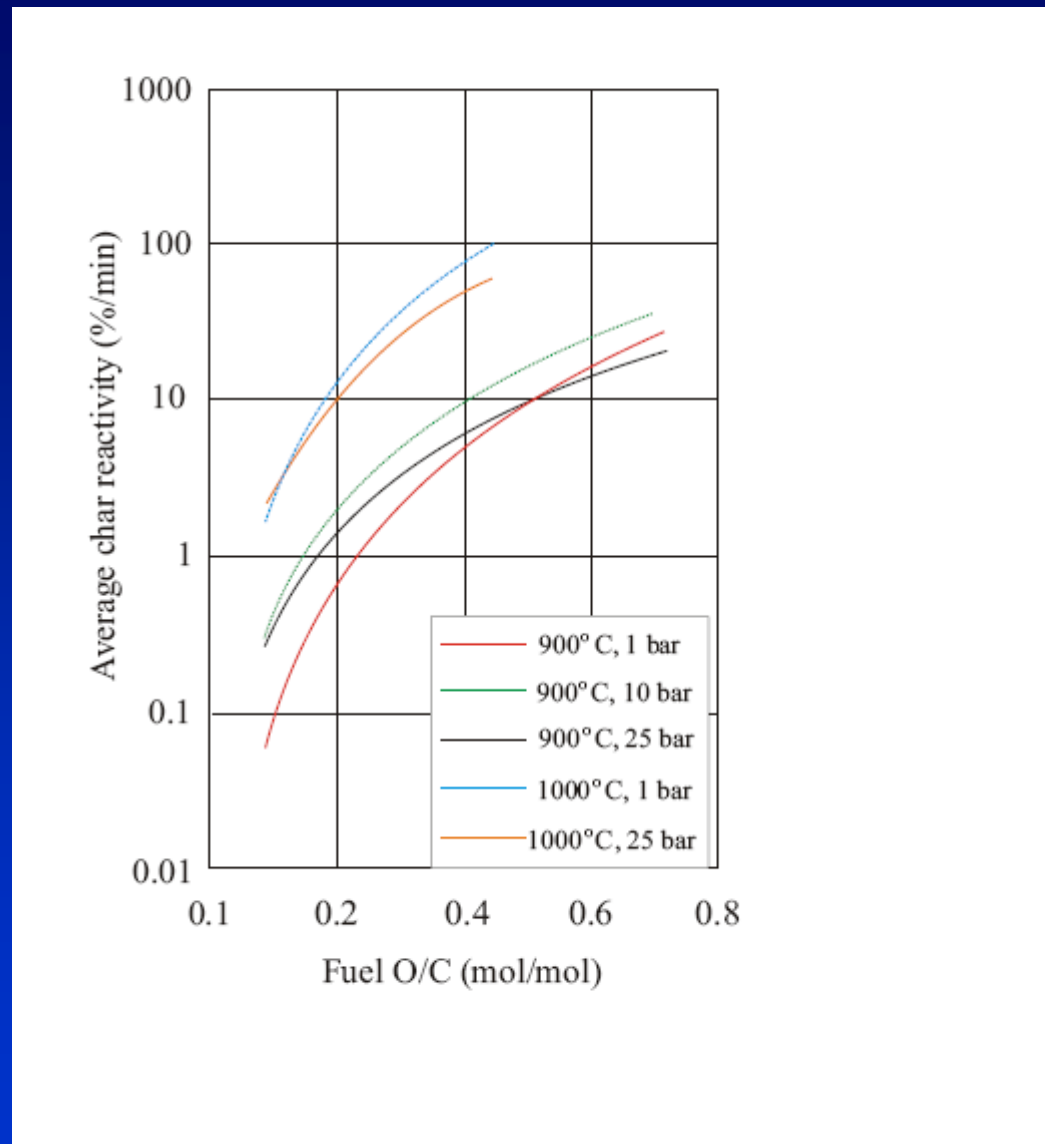

## Higher fuel ratio - lower reactivity

Zevenhoven and  
Hupa, 1997

Fuel ratio - ratio between Fixed carbon and Volatile matter

## Higher O/C ratio – higher reactivity

# Fuel ratio

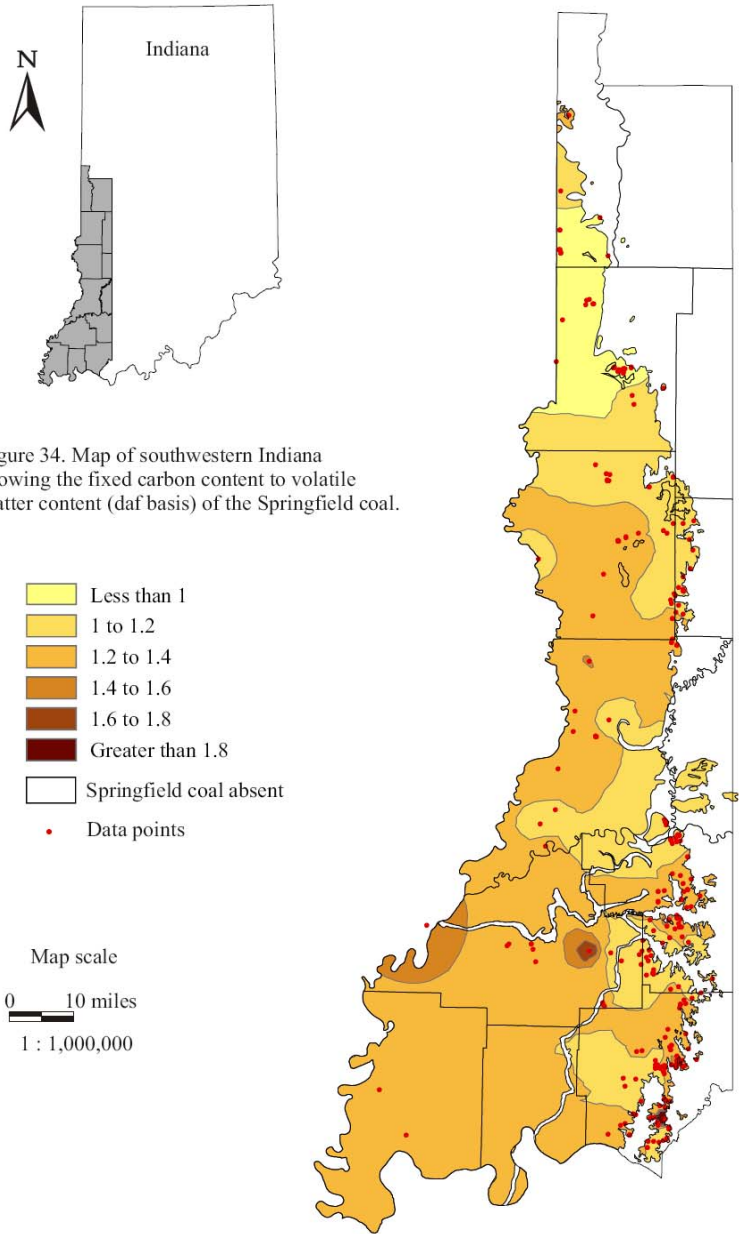

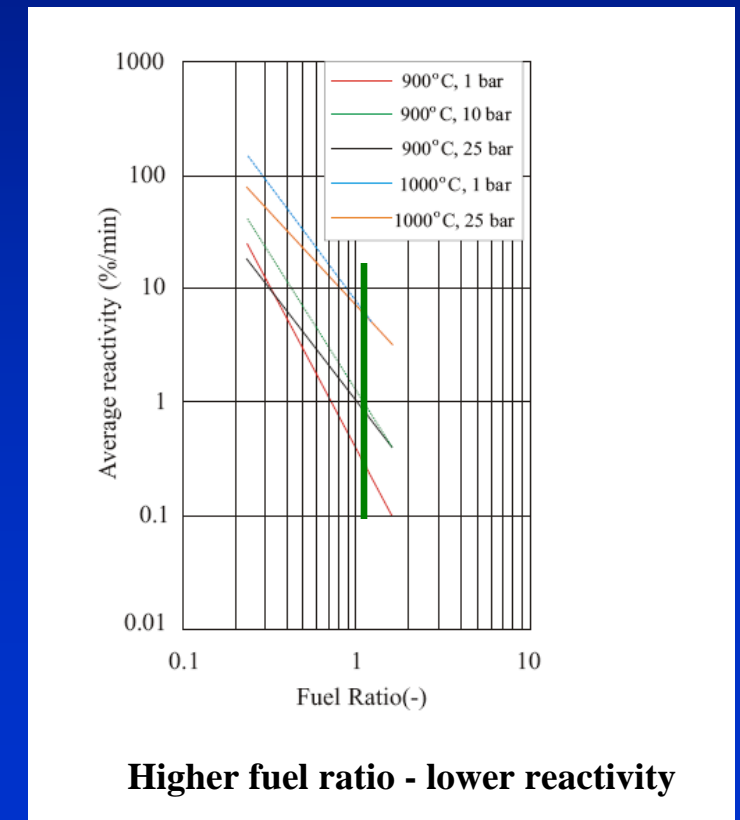

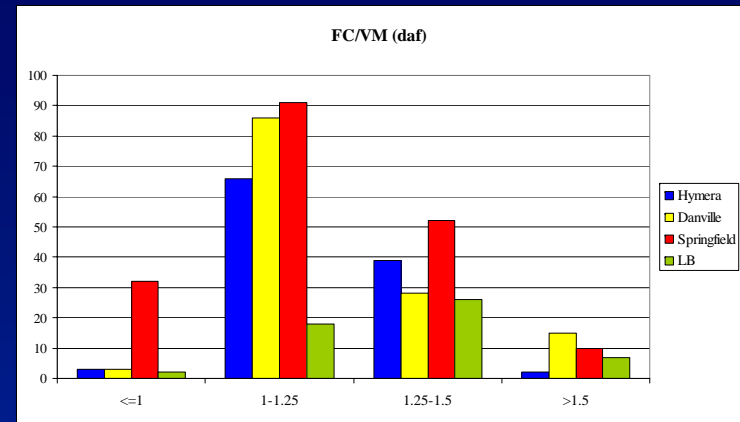

Figure 34. Map of southwestern Indiana showing the fixed carbon content to volatile matter content (daf basis) of the Springfield coal.

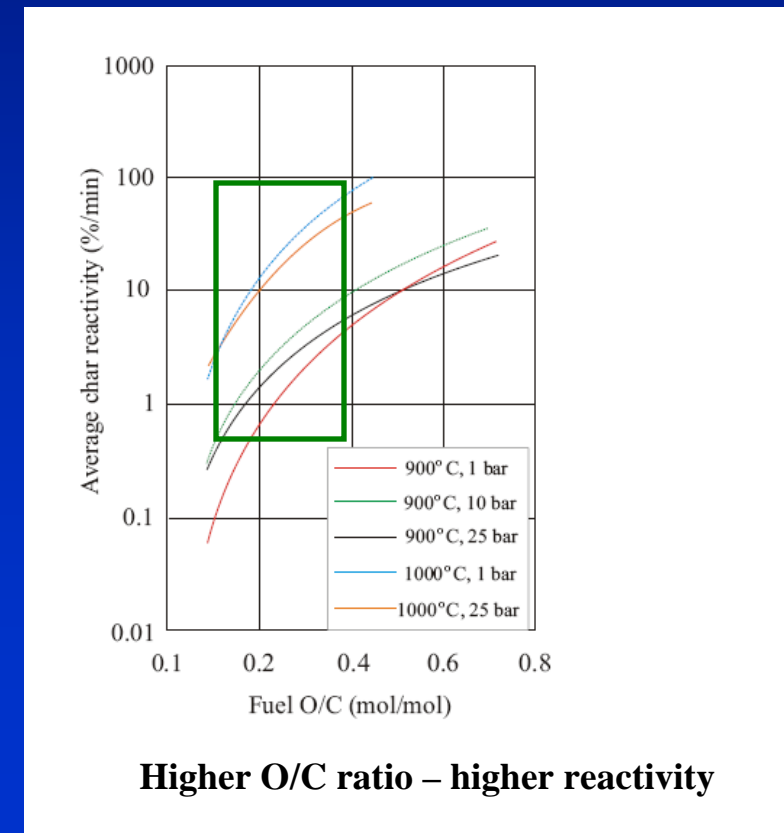

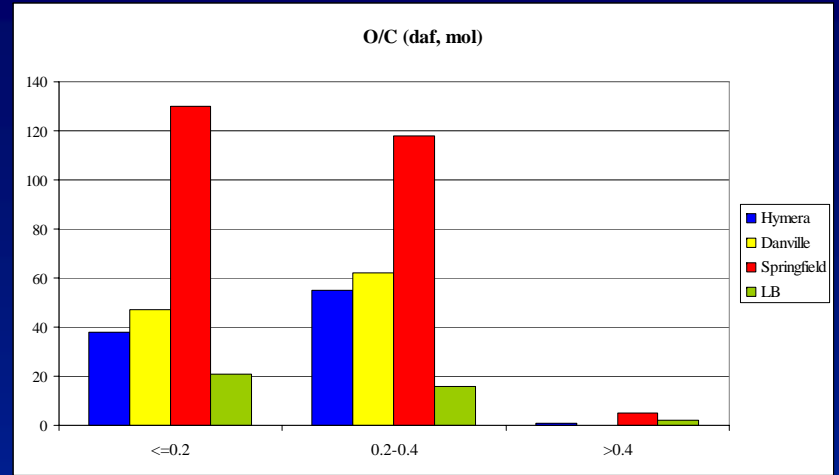

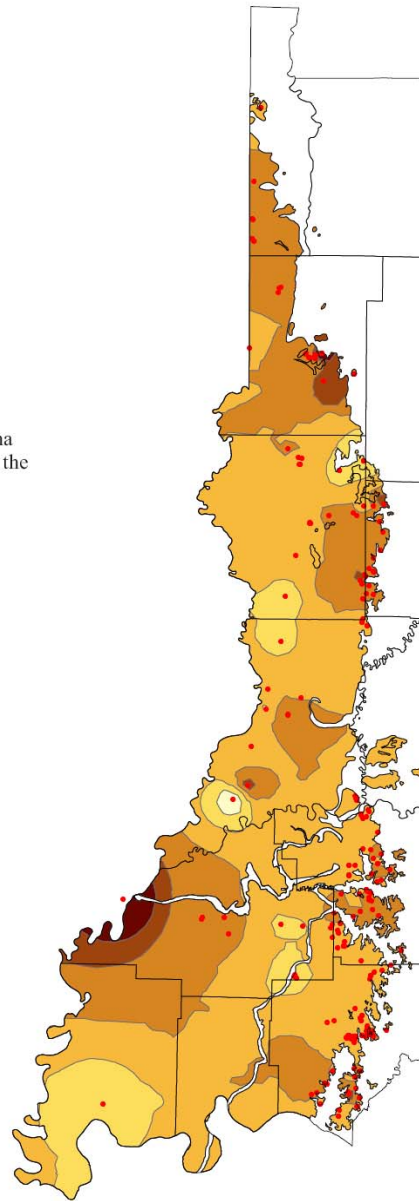

# O/C ratio

Figure 42. Map of southwestern Indiana showing the O/C value (daf, molar) of the Springfield coal.

Map scale  
 0 10 miles  
 1 : 1,000,000

# Summary of preliminary evaluation of Indiana coals for IGCC

- Btu, moisture, ash, sulfur – good to very favorable
- Reactivity – no direct data but fuel ration and O/C ratio suggest adequate reactivity
- **Slag behavior - ??????? – insufficient data on ash chemical composition and ash fusion temperatures**
- **Slag properties???**

## Barriers to using Indiana coal in IGCC

The main barriers are the same as those for using IGCC technologies and building new IGCC plants in general, and, among others, include:

- 1) High capital cost,
- 2) Unfamiliarity of the technology to utilities (IGCC plants are more chemical plants than boilers),
- 3) Relatively long time to gain full plant capacities (this, however changes with experience)
- 4) Reliability concerns,
- 5) Project financing – bankers need guarantees or assurance that gasifiers will perform well,
- 6) Economic uncertainties – tax incentives, multi-pollutant legislations, and
- 7) Public perception about any new coal-using power plants

# Barriers to using Indiana coal in IGCC

The barriers that are specific or related to the properties of Indiana coals and that might prevent potential IGCC plants from selecting Indiana coal as IGCC feedstock include:

- Insufficient information about ash characteristics such as ash composition and ash melting properties and, consequently, difficulty of predicting slag behavior in a gasifier;
- Insufficient information about chlorine content of Indiana coals. There is a perception that Indiana coals, similar to some Illinois coals, are high in chlorine. This does not appear to be the case, but not enough data are available to disprove it, and
- Price of the coal

# Task 4:

**Propose new research to provide a comprehensive evaluation of Indiana coals for IGCC**

- Mineral matter (ash) composition
- Ash melting point and slag viscosity
- Petrographic composition
- Chlorine in Indiana coals
- Modeling of IGCC performance of Indiana coals

# Tasks and milestones

Task 1: Field work: Samples collection and preparation

Task 2: Sample preparation and analysis for mineral matter properties

Task 3: Petrographic analysis

Task 4: Data integration and database update

Task 5: Modeling and final report evaluation

2006

2007

2008
