

# Nuclear Energy: Generation & Storage

Clayton Meranda, Josh Campbell,  
Nathaniel Browne, Matthew von Werder

# Fission

- ▶ The process of one atom splitting into multiple parts, releasing energy
- ▶ Enriched uranium undergoes induced fission in a reactor: Fired neutrons split Uranium atom; energy is released

# Energy Conversion

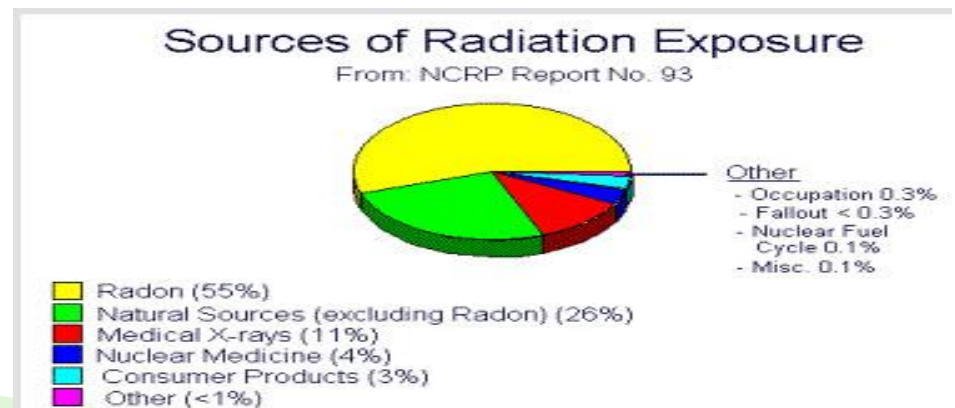

1

# Nuclear Information

- ▶ Nuclear plants are fully competitive with fossil fuel plants
- ▶ Nuclear energy isn't 100% emissions free
- ▶ Plants can't exist without government subsidies
- ▶ Private investors won't fund because of risk

3

# Current Usage

- ▶ Provides 13–14% of the world's electricity
- ▶ U.S., France, and Japan account for about half of that electricity
- ▶ 436 nuclear reactors around the world
- ▶ Total US nuclear plants produce roughly 20% of nation's electricity supply
- ▶ 150 US naval vessels powered by nuclear energy

# Sustainability

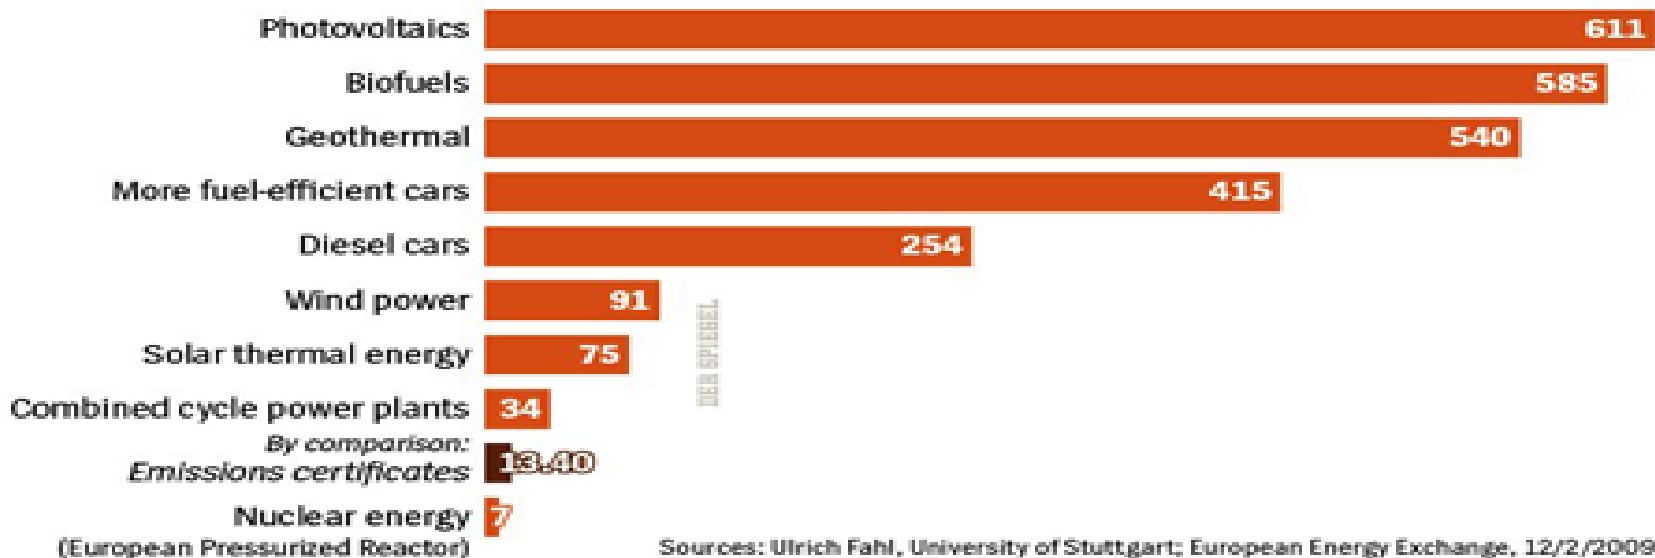

- ▶ Constant advancement in nuclear field
  - ▶ New processes being developed to increase efficiency
  - ▶ Nuclear energy industry is the **only** power-producing entity to take full responsibility for all waste products
  - ▶ Cost of waste product management is added to the cost the power supplier charges
- 

# Costs

- ▶ Nuclear energy comes out to approximately \$30 per megawatt hour
- ▶ Coal comes in at about \$29.10 per megawatt hour

## The Cost of Cleaner Energy

The maximum costs of diverse measures to prevent one ton of CO<sub>2</sub> emissions, in euros

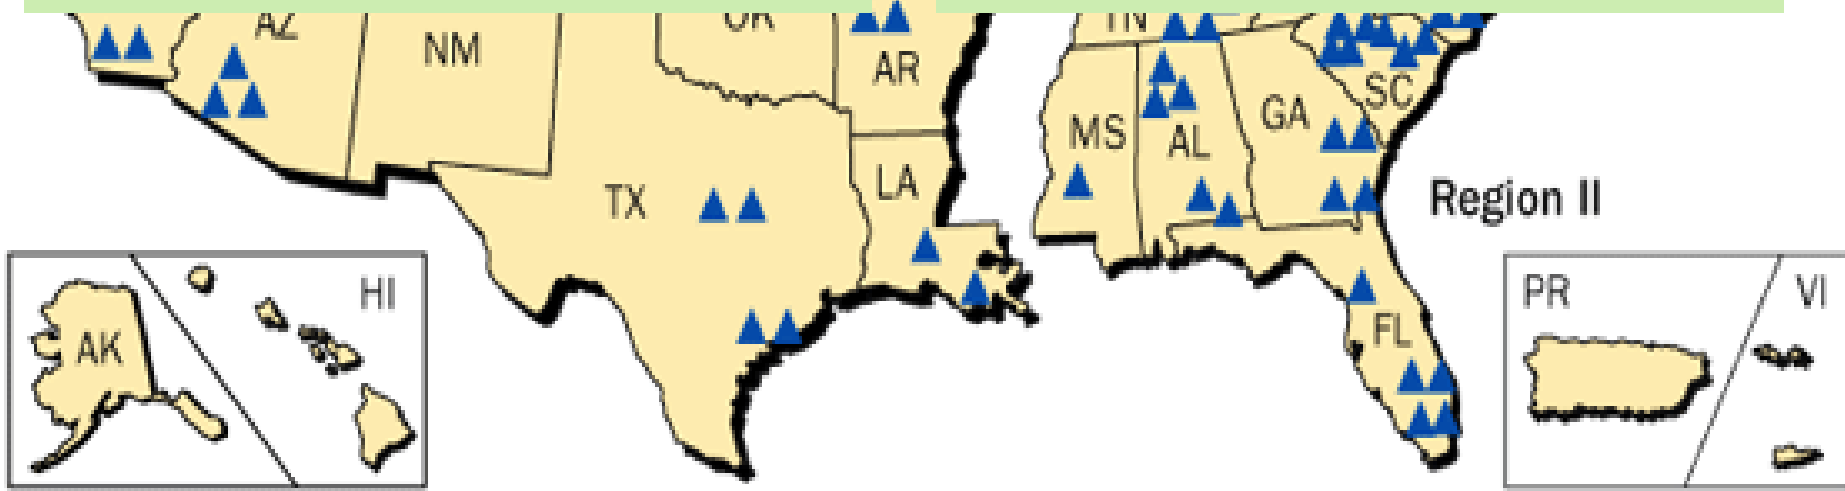

Sources: Ulrich Fahl, University of Stuttgart; European Energy Exchange, 12/2/2009

### Advantages

- ▶ Technology is readily available
- ▶ Economical and efficient power
- ▶ Low environmental impact

### Disadvantages

- ▶ Waste storage
- ▶ Several Risks

▲ Licensed to Operate (104)

# Purdue University Nuclear Reactor Number One (PUR-1)

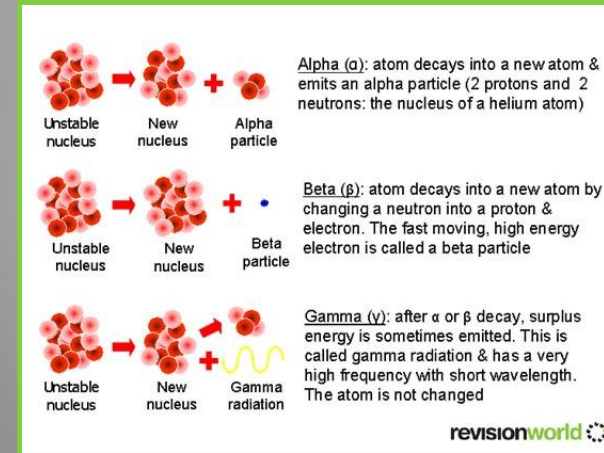

- ▶ Indiana's first and only nuclear reactor
- ▶ Produces 1000 watts maximum
- ▶ Located underground in the Electrical Engineering building

# Radioisotope Batteries

8

- ▶ Emitted particles contact conductive medium, directed into stream of electricity
- ▶ Non-thermal: betavoltaics
- ▶ Thermal technologies: thermoelectric, thermoionic

9

# Long-Lasting Energy for Remote Locations

- ▶ Simple nuclear batteries provide power for 10–20 years
- ▶ Potential lifespans of centuries
- ▶ Early pacemakers
- ▶ Used by NASA probe missions (*Voyager*, *Ulysses*, *Curiosity*)

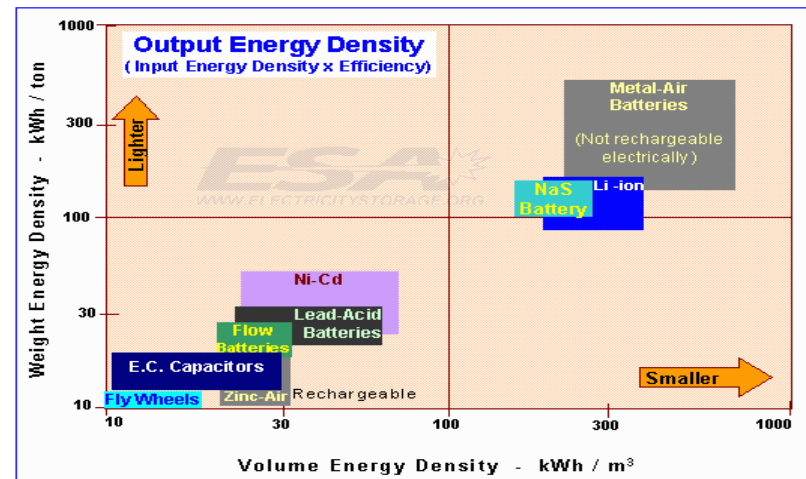

# Storing the energy

14

Storage Technologies	Main Advantages (relative)	Disadvantages (Relative)	Power Application	Energy Application
Pumped Storage	High Capacity, Low Cost	Special Site Requirement		●
CAES	High Capacity, Low Cost	Special Site Requirement, Need Gas Fuel		●
Flow Batteries: PSB, VRB, ZnBr	High Capacity, Independent Power and Energy Ratings	Low Energy Density	◐	●
Metal-Air	Very High Energy Density	Electric Charging is Difficult		●
NaS	High Power & Energy Densities, High Efficiency	Production Cost, Safety Concerns (addressed in design)	●	●
Li-ion	High Power & Energy Densities, High Efficiency	High Production Cost, Requires Special Charging Circuit	●	○
Ni-Cd	High Power & Energy Densities, Efficiency		●	◐
Other Advanced Batteries	High Power & Energy Densities, High Efficiency	High Production Cost	●	○
Lead-Acid	Low Capital Cost	Limited Cycle Life when Deeply Discharged	●	○
Flywheels	High Power	Low Energy density	●	○
SMES, DSMES	High Power	Low Energy Density, High Production Cost	●	
E.C. Capacitors	Long Cycle Life, High Efficiency	Low Energy Density	●	◐

- Fully capable and reasonable
- ◐ Reasonable for this application
- Feasible but not quite practical or economical
- None Not feasible or economical

12

# How it works

16

- ▶ Molten Sodium Sulfur at approximately 300C
- ▶ Approximately 89% efficiency
- ▶ Lifetime of 2,500 cycles (at 100% DOD – depth of discharge)
- ▶ Approximately 20–50 kW (per cell)

18

19

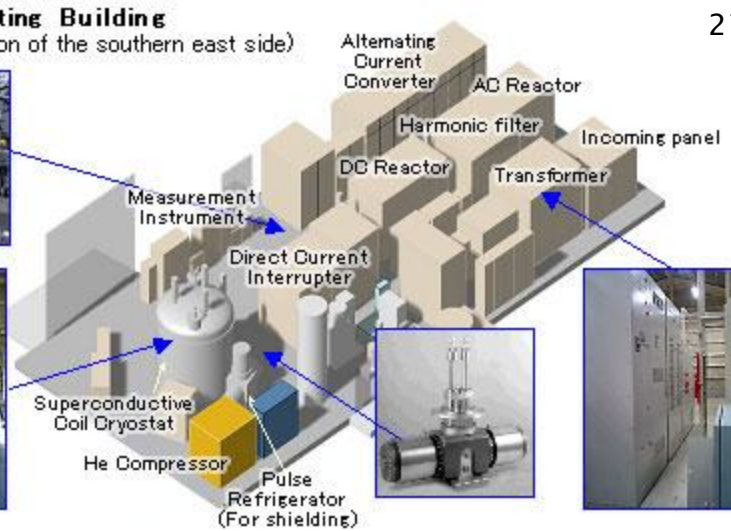

# SMES

## SMES Field Testing Building

(Seen from the position of the southern east side)

- ▶ 95% Efficiency
- ▶ No moving parts
- ▶ 1–20 MW–h
- ▶ 2/20/200 MW
