Hi all,

Just providing some additional information for the topic of the cognitive colloquium this week. Our area decided to have an open forum about open science practices. The purpose is to have a discussion about the potential pros and cons of some of the proposed changes to research and publishing practices associated with open science. An additional goal is to make sure students are aware of changes that journals are implementing in response to open science initiatives, and what they mean for collecting data and publishing. Although all cognitive colloquia are open to all areas, this topic may be of particular interest to individuals who do not typically attend the cognitive colloquium.

Below is a link to Spellman et al.’s recent chapter providing a primer on open science for those that are interested.
