This research experience will include in-home and laboratory visits during the spring/summer of 2017. Sessions will involve observing you interact with your child, as well as providing you with evidence-based practices to target your child’s social development. Activities will be structured around daily routines, such as mealtime and indoor play.

We are looking for infants/toddlers under 36 months of age who are showing signs of a developmental delay, or concerning behaviors. All younger siblings of children with a developmental disorder, language delay, a diagnosis associated with developmental concerns (e.g., autism), or low birth weight are eligible.

If interested in participating, please contact us by phone or email!
