

Homework H.4.A

Given: Particle P (of mass m) moves along a rough surface (with a coefficient of kinetic friction of μ_k between P and the surface). At one instant when P is at a position on the path that has a radius of curvature of ρ , P has a speed of v with the velocity vector for P being oriented at a clockwise angle of θ from the vertical.

Find: For this position,

- Determine the normal component of force of the path acting on particle P.
- Determine the rate of change of speed of particle P.

Use the following parameters in your analysis: $\mu_k = 0.2$, $m = 4$ kg, $\rho = 0.5$ m, $\theta = 36.87^\circ$ and $v = 30$ m/s.
