

Homework H.4.L

Given: At the instant the cable fails, the crate of mass m is traveling up the slope with a speed v_0 . The coefficient of kinetic friction between the crate and the plane is μ_k .

Find: Determine the speed of the crate, v , at a time of Δt after the cable fails.

Use the following parameters in your analysis: $m = 90$ kg, $v_0 = 15$ m/s, $\mu_k = 0.25$, $\theta = 30^\circ$ and $\Delta t = 1.5$ s.
