2 General Requirements
2.1 Voltage
   - 12.47 KV Primary system voltage
   - 2400 V Primary system voltage

2.2 Building transformers located within a building vault are to be substation type and are to be flange connected to the primary disconnecting means and throat / busway connected to the secondary switchgear.

2.3 Pad mounted transformers may be used where there is no building electrical vault with owner approval.

2.4 Sample Specifications can be provided for Liquid Filled Unit Sub-Station Transformers and PadMount Liquid Filled Transformers

3 Grounding
3.1 The transformer shall have a 4/0 copper 600 v insulated green colored grounding conductor installed between the Xo bushing and a grounding pad.

3.2 The transformer shall have the two diagonally opposing ground pads connected by separate 4/0 bare copper conductors through PVC conduit sleeves inserted through the foundation pads to the grounding grid.

3.3 All grounding connections shall be copper, 2-hole, compression lugs.

3.4 The low voltage termination spades shall have an adequate number of holes to accept an additional number of ANSI two-hole lugs to accommodate the additional grounding and bonding conductors. Additional cable supports shall be provided when applicable to relieve pressure from the transformer phase and neutral bushings. The engineer of record shall determine the number of ANSI two-hole lugs required and increase the size of the termination spade accordingly.

4 Testing
4.1 All specified testing reports shall be submitted and review by the Energy and Utilities electrical engineer prior to transformer energization.
